# Innovation in credentialing: the andros API

Our data, your platform

With the launch of the andros client API, your technology platforms can communicate directly with androsCredentialing*. Your programs and apps can now leverage our NCQA-certified CVO technology.

Your engineering team can automate workflows or develop triggers that allow andros users on your team to take proactive control of credentialing processes and:

- Reduce the risk of error
- Decrease manual user time
- Increase insight into provider rosters
- Provide proactive control over workflows

Kickstart credentialing

With the andros API, you can initiate credentialing faster, directly from your data source. Do away with manual uploads of CSVs or batch files by sending provider profiles from your provider data management platform to androsCredentialing*. You can even automate programmatic imports of provider lists, eliminating error-prone manual processes and reducing turnaround times.

Enhance native provider profiles

With the andros client API, you will have easy access to the data you need when you need it for recordkeeping, compliance, and audit purposes. Automate project status reporting by pulling andros data into your platform, so there's no need to log into androsCredentialing*. Integrate data, including complete, NCQA-certified credentialing reports, in your provider data platform programmatically.

Manage workflows proactively

Actively manage your providers in credentialing and monitoring cycles by retrieving status and updating decisions directly from your data platform. Pre-written queries allow you to search for and identify providers who meet the criteria you define and take direct action: approve, deny, or terminate the provider relationship to stop the credentialing or monitoring process.
