The World's Most Advanced Cloud Based CVO

The andros credentialing solution has transformed the way companies credential provider networks. Drawing on the data housed in 7.5 million individual and institutional provider identity graphs in the a* platform, andros credentials providers up to ten times faster than industry standards and traditional manual workflows.

Easy for you, easier for your providers.

Unmatched Expertise

We've built the most compliant CVO in North America, with 11 NCQA certifications, so our depth of experience credentialing providers in every US state can help you stay compliant as you grow your provider network.

Simple Application Process

Our NCQA-compliant process eliminates the burden on your team. Credentialing can be initiated using CAQH, your own provider credentialing application, or the andros provider application. This reduces the risk of inaccurate submissions by supplementing provider information from verified sources.

Automated Verification

Our credentialing system automates processes that historically required exponentially more in-person hours in legacy systems. Data-matching algorithms provide instant primary source verification and identify any gaps that could lead to roadblocks such as malpractice, licensure, or sanctions issues.

Delegated Credentialing

With the help of our certified compliance team, we can help you through the delegated credentialing process with your payors in order to save time, money, and administrative hassle for both you and your practitioners.

Support Beyond the Report

We don't stop supporting our clients once the credentialing process ends. Where the a* platform cannot resolve the discrepancy, the andros team digs in to work with providers and facilities to resolve any flagged issues and ensure credentialing reports are accurate and up-to-date.

Committee Management

andros streamlines Committee meeting preparation and management by preparing essential reporting, drawing up provider summaries and creating a clear agenda for quick and easy decisions.
